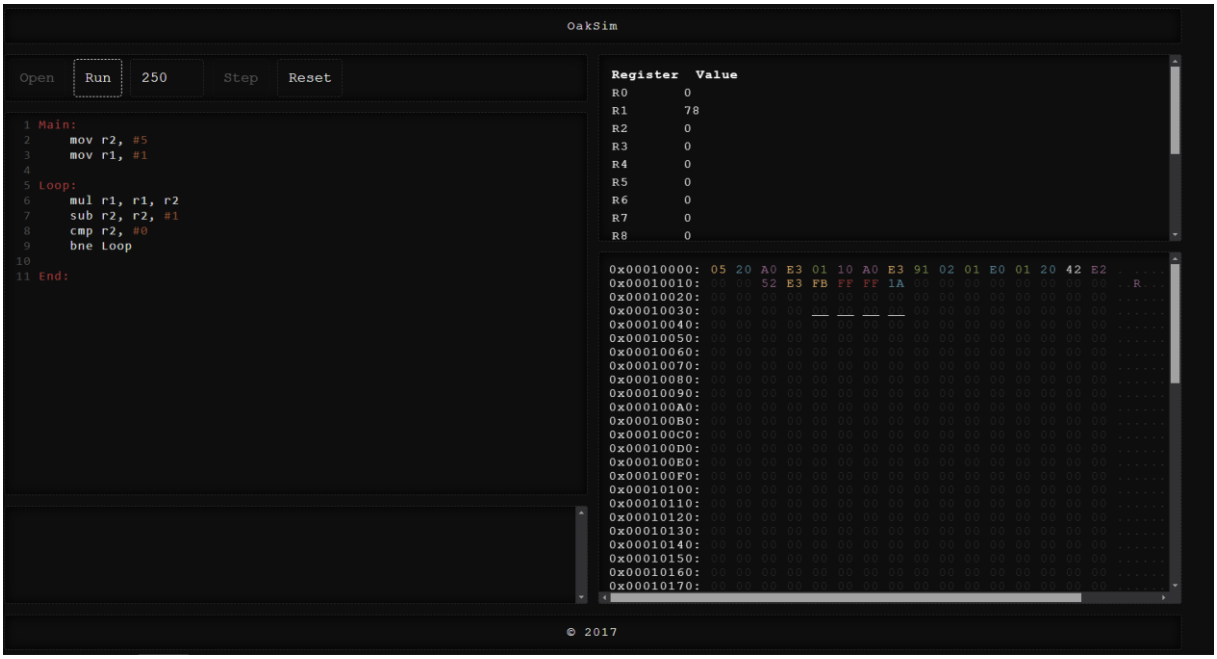
Template Week 4 – Software

Student number:

Assignment 4.1: ARM assembly

Screenshot of working assembly code of factorial calculation:



Assignment 4.2: Programming languages

Take screenshots that the following commands work:

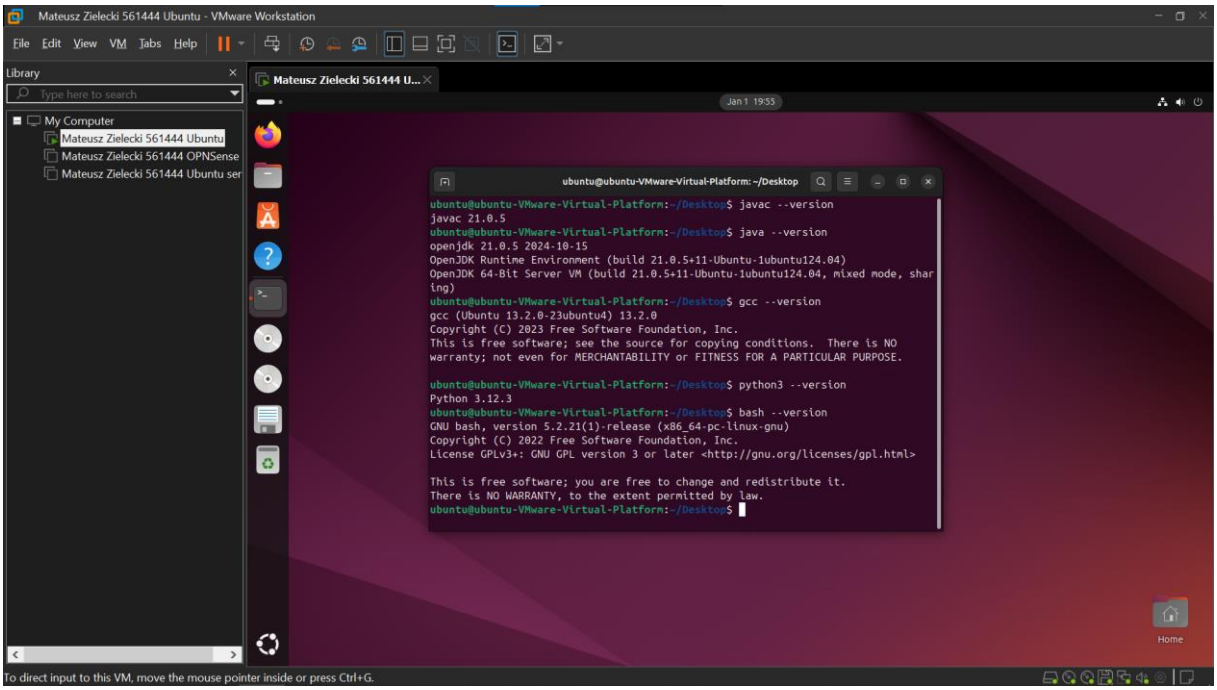
javac --version

java --version

gcc --version

python3 --version

bash --version



Assignment 4.3: Compile

Which of the above files need to be compiled before you can run them? fib.c and Fibonacci.java

Which source code files are compiled into machine code and then directly executable by a processor? fib.c

Which source code files are compiled to byte code? Fibonacci.java

Which source code files are interpreted by an interpreter? fib.py

These source code files will perform the same calculation after compilation/interpretation. Which one is expected to do the calculation the fastest? fib.c

How do I run a Java program? javac Fibonacci.java -> java Fibonacci

How do I run a Python program? python3 fib.py

How do I run a C program? gcc fib.c -o fib -> ./fib

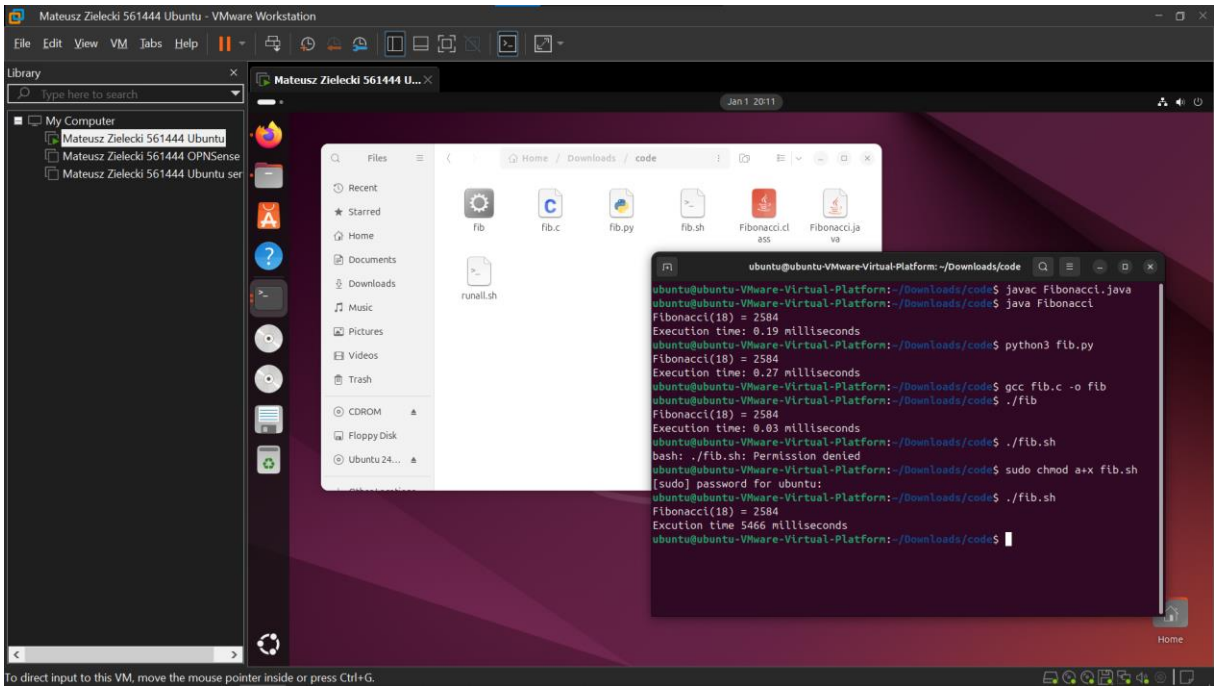
How do I run a Bash script? ./fib.sh

If I compile the above source code, will a new file be created? If so, which file?

Compiling C will create machine code executable file, here fib
Compiling Java will create new byte code file, here Fibonacci.class

Take relevant screenshots of the following commands:

- Compile the source files where necessary
- Make them executable
- Run them
- Which (compiled) source code file performs the calculation the fastest?



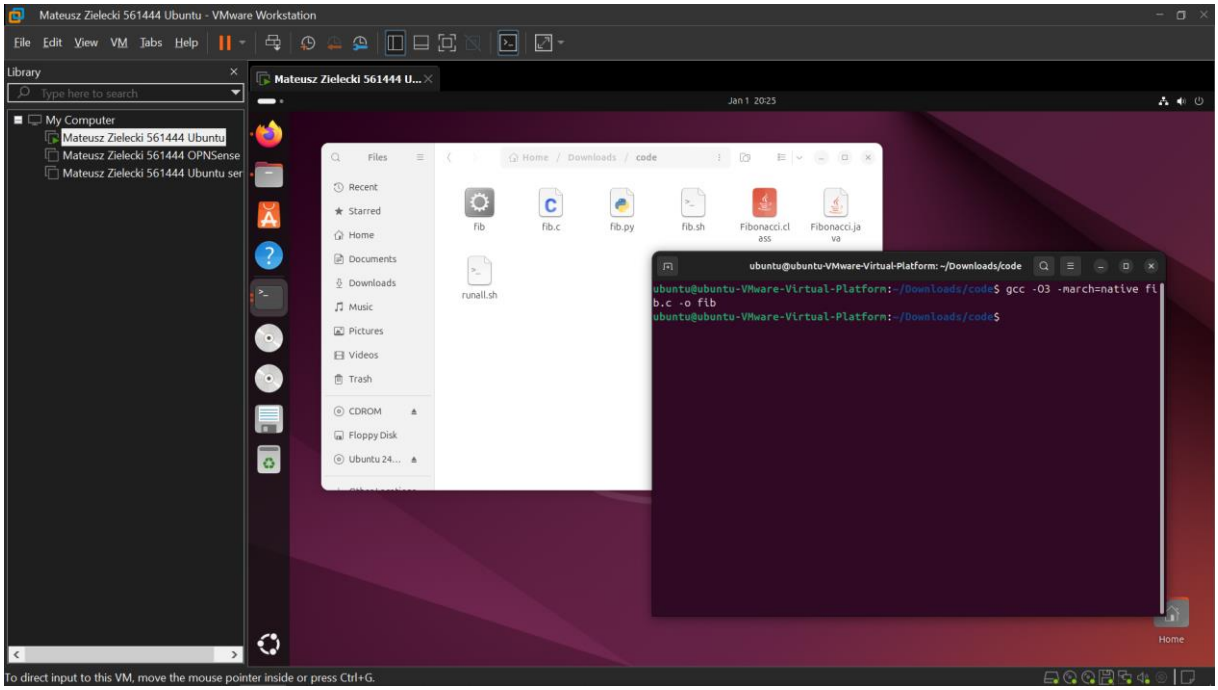
The fastest calculation was performed by C script

Assignment 4.4: Optimize

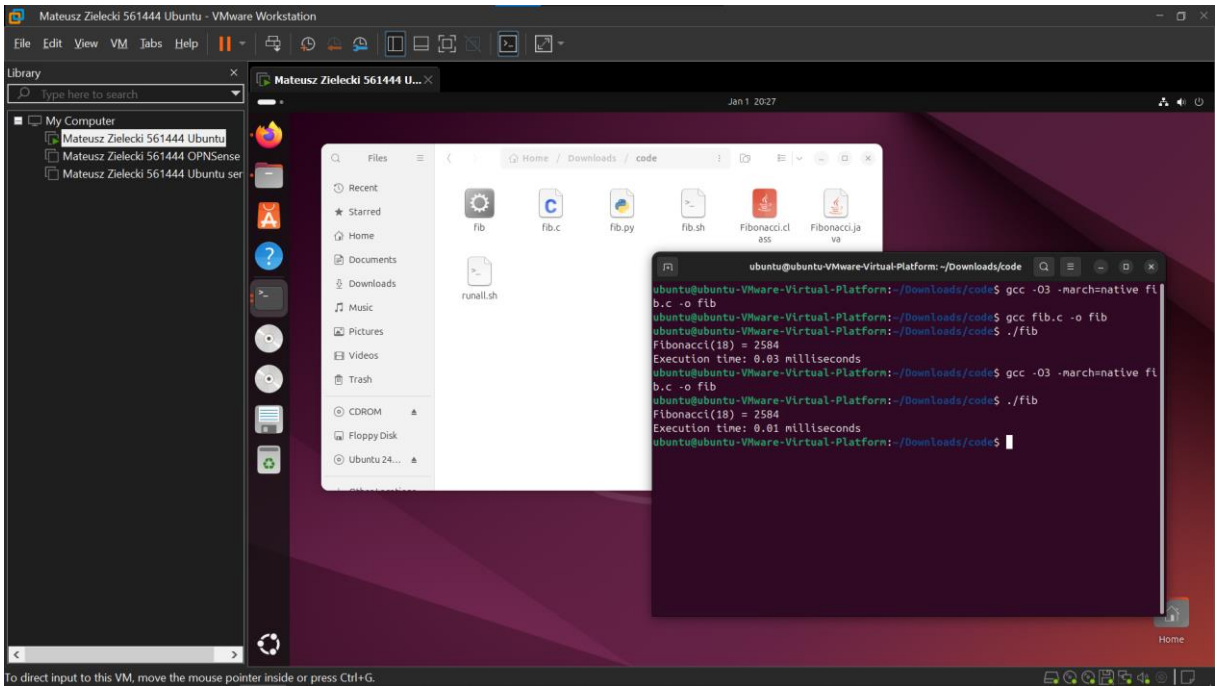
Take relevant screenshots of the following commands:

a) Figure out which parameters you need to pass to **the gcc** compiler so that the compiler performs a number of optimizations that will ensure that the compiled source code will run faster. **Tip!** The parameters are usually a letter followed by a number. Also read **page 191** of your book, but find a better optimization in the man pages. Please note that Linux is case sensitive.

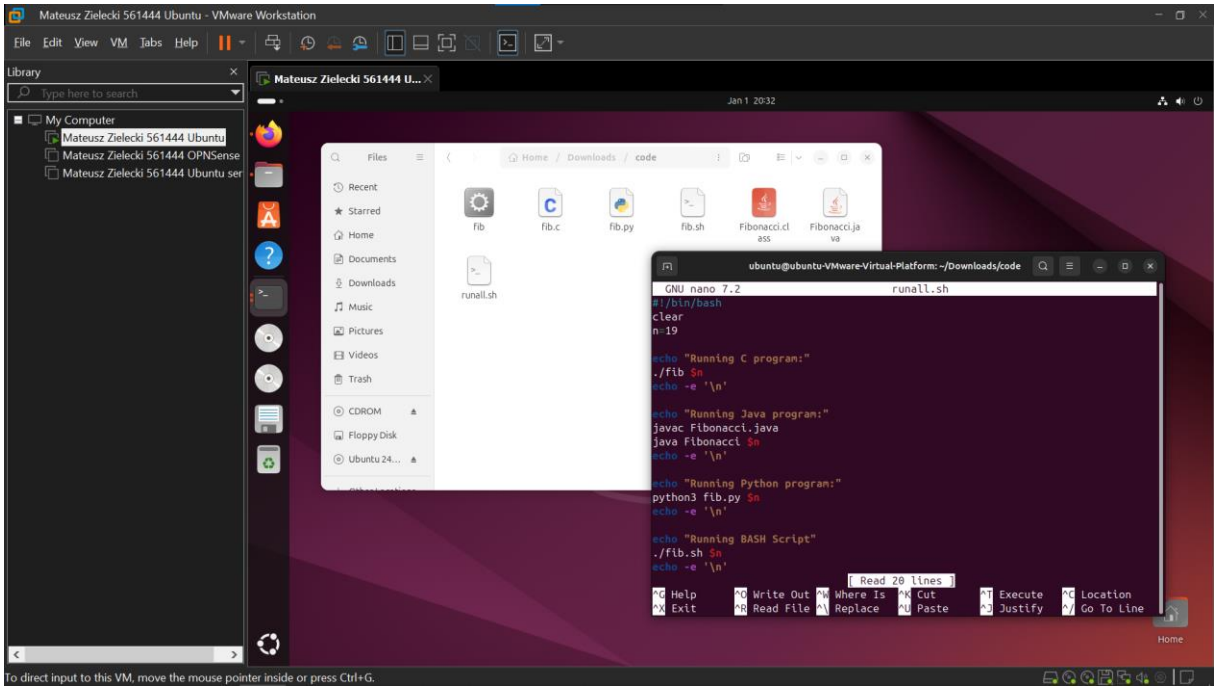
b) Compile **fib.c** again with the optimization parameters

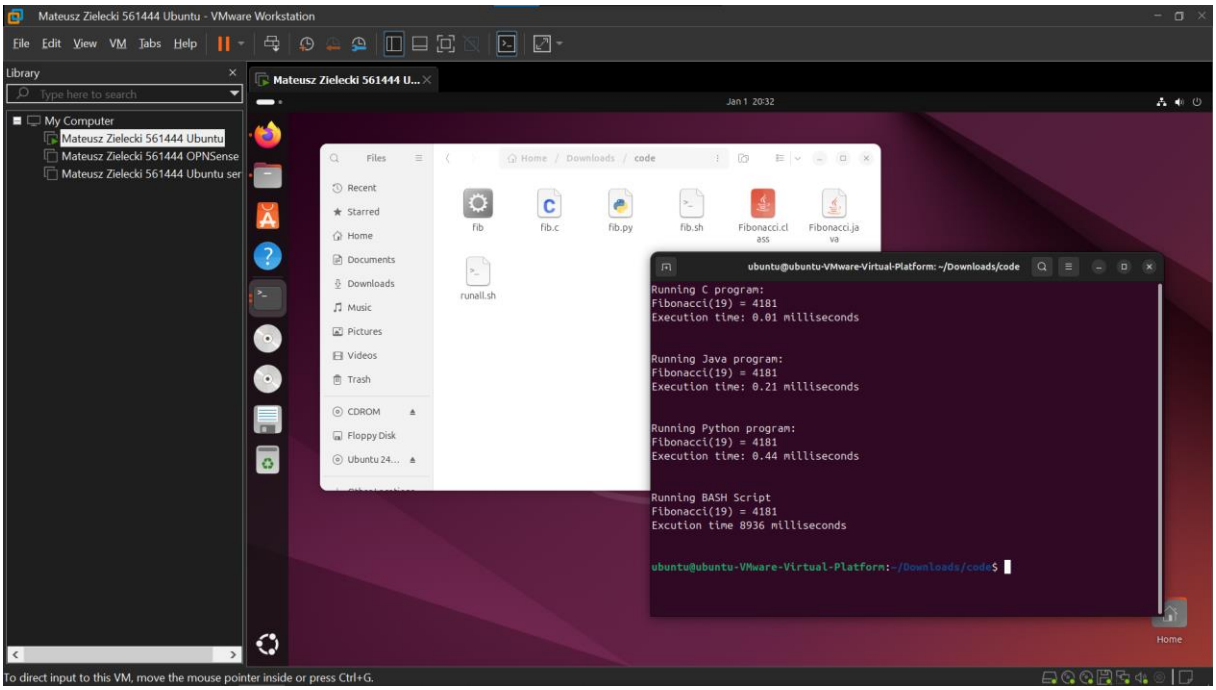


c) Run the newly compiled program. Is it true that it now performs the calculation faster?



d) Edit the file **runall.sh**, so you can perform all four calculations in a row using this Bash script. So the (compiled/interpreted) C, Java, Python and Bash versions of Fibonacci one after the other.





Bonus point assignment – week 4

Like the factorial example, you can also implement the calculation of a power of 2 in assembly. For example you want to calculate $2^4 = 16$. Use iteration to calculate the result. Store the result in r0.

```
Main:
        mov r1, #2
        mov r2, #4
        mov r0, #1
Loop:
        cmp r2, #0
        beq End
        mul r0, r0, r1
        sub r2, r2, #1
        b Loop
End:
        mov r7, #1
        swi 0
```

Complete the code. See the PowerPoint slides of week 4.

Screenshot of the completed code here.
